

ABSTRACT

[0031] Entry of a specific telephone number on a remote communication terminal (KE-A) initializes setup of a connection between the remote communication terminal (KE-A) and the communication installation (PBX). The central control unit (CC) of the communication installation (PBX) recognizes the specific telephone number and then activates a callback module (M-RR) of the communication installation (PBX) and terminates setup of the connection. The central control unit (CC) then automatically initializes setup of a new connection between the communication installation (PBX) and the remote communication terminal (KE-A) by accessing the callback module (M-RR) (PBX).
